

QWIK-TIP, INC. (Elk Grove, IL) introduces the Qwik-Tip II, redesigned to improve operator safety and productivity. Qwik-Tip units are in service with national haulers, private haulers and municipalities in three countries for 13+ years. The Qwik-Tip was designed with operator safety as the primary design factor. Every year, commercial rear loader drivers experience injuries associated with manually latching the trunion bar and from accidents that occur once the container has been raised to the dump position, the packing cycle has been started but the container is not properly locked in place. All of the Body Mfg.'s offer Lip and Latch kits that by the nature of their design allow movement of the container trunion bar both vertically and horizontally and requires the operator to make the decision to use the trunion latches in the first place when using the winch.

Even the hydraulically-operated trunion lockers on the market allow movement of the container trunion bar both vertically and horizontally, and in field testing an ANSI Standard trunion bar (ANSI Z245.60-2008) can be removed with the lockers in the locked position. The Qwik-Tip II with its Locking Hooks is the only product on the market today that locks the trunion bar onto the load sill and prevents any movement of the container's trunion while in the dump position.

Make a real impact on your "Days Without a Loss Time Accident" record: insist on the Qwik-Tip II for all your rear loaders. Your drivers will thank you and operations will love the route time savings that improve profitability.
